

Weather Event Response Capacity

February 2026 - Daily job throughput vs. unrealised capacity

Reading this chart: Orange bars show jobs completed each day. Grey bars (from Wed 18 Feb) represent *unrealised capacity* - work Duncan & Taylor was resourced and available to perform, but could not access because third-party insurers were directing jobs to other contractors. The dashed reference line marks D&T's daily assigned capacity of ~50 jobs (and left us under-utilised). Lighter bars (Fri 20 - Tue 24 Feb) are projected values based on the prevailing trend.

D&T were sent approximately 100 jobs over the course of this event. Our actual daily throughput capacity is closer to 100 jobs *per day* without calling in additional resource - meaning the work directed to us

represented less than 20% of what we could have handled.

AIR TRAFFIC CONTROL

Triage-first dispatch, up to 600 jobs per day

D&T's proprietary **Air Traffic Control** platform gives our triage team live visibility across every incoming claim. The moment a job arrives, custom software classifies it by risk severity and dispatches the right resource at the right priority, enabling D&T to coordinate up to 600 jobs per day across our network, even at the peak of a major weather event.

 DOUBLE RED	Emergency Priority Risk to life - structural collapse, live electrical hazard, active flooding of occupied dwellings. Response is immediate and unconditional. All available resources are redirected.	Immediate "Faster than the fire service"
 RED	Urgent Priority Threat of significant further or ongoing damage, or vulnerable claimants (elderly, disabled, families with young children). Active threat that will worsen without same-day intervention.	Same day Notified within 1 hour
 ORANGE	Standard Priority The majority of claims. Make-safe is needed today - roof damage, broken windows, water ingress. Situation is stable but must be secured promptly to prevent escalation.	Same day Notified within 1 hour
 YELLOW	Monitored Priority Make-safe is needed, but ongoing risk is minimal. Property is liveable and deterioration is slow. Scheduled for same-day attendance where capacity allows.	Same day Notified within 1 hour
 GREEN	Routine Works required and light make-safe needed, but no significant ongoing risk. Property is safe and stable. Scheduled efficiently into the daily workflow.	Same day Notified within 1 hour

HOW WE WORK

The D&T Methodology

A single coordinated site visit replaces the fragmented multi-visit cycle typical of third-party loss adjusters - cutting homeowner disruption, compressing claim timelines, and replacing opaque margin stacking with a flat, fully auditable 10% fee.

HOMEOWNER DISRUPTION

How many times does the homeowner need to be home?

STEP BY STEP

From delegation to completion

2

STEP 2 - CRITICAL

One Site Visit

Two specialist functions execute in parallel during a single homeowner appointment.

TRACK A

Builder

Performs emergency make-safe - weatherproofing, hazard mitigation, temporary repairs

TRACK B

Scoper

Captures visual model (including 3D on bigger losses), photo documentation, and video walkthrough of the full scope

Both tracks complete in one visit, so the homeowner is not called back

Without D&T: 3+ separate visits across different contractors and assessors. Each requires the homeowner to be present, and delays accumulate between parties.

3

STEP 3

Real-time Processing

Captured scope is automatically processed and priced via our platform. The insurer receives an immediate reserve expectation - no waiting for a slow assessment report to be written and submitted. A.I. systems supplement human workers to speed up and improve accuracy of their assessments. Insurer-internal teams have platform access to review this in real-time as it is created.

Without D&T: Pricing and scoping is overly manual and error-prone, produced by the assessor days or weeks after their visit, often requiring back-and-forth clarification before a reserve can be set.

4

STEP 4

Competitive Tender

The documented scope is still shared with other builders/main contractors, who tender against a clear and unambiguous brief. Competition drives pricing discipline without the insurer needing to manage the tender process directly.

5

STEP 5

Real-Time Audit

The insurer logs into the D&T platform to review video, imagery, and documentation remotely at any time. Claim progress is visible without requiring a physical site visit from any insurer representative.

Without D&T: An assessor must attend the property physically to verify scope or progress - adding cost, delay, and further homeowner disruption. Near-impossible in even moderately sized events.

6

STEP 6

Reinstatement

The preferred builder proceeds with a clear scope, agreed price, and full documentation already in place. No ambiguity, no re-scoping, no variation disputes arising from an incomplete initial brief.

7

STEP 7

Transparent Margin

D&T applies a flat 10% margin over actual cost. Every invoice and every hour is auditable on the platform. The insurer pays for real work at a known rate - nothing more.

Without D&T: Layered, opaque third-party fees - loss adjuster, project manager, and builder margins stacked without full cost visibility for the insurer.

WHY IT MATTERS

Quantified advantages for insurers**NPS & Customer Satisfaction****1 visit**

One homeowner appointment vs. 3 or more. Fewer disruptions correlate directly with higher NPS scores on settled claims.

**Claim Speed****Same day**

Reserve expectation set on the day of the site visit. No waiting for manual assessment reports before the claim can progress.

Transparency

100%

Full 3D, photo, and video documentation accessible remotely by the insurer at any time. No information asymmetry between parties.

Cost Certainty

10% flat

Single transparent margin over auditable actual cost. Eliminates stacked third-party fees and unverifiable overheads.

FEE STRUCTURE

How D&T charges

INPUT A

Labour time

Every hour logged against the job. Auditable on the platform by the insurer in real time.

+

INPUT B

Material invoices

All supplier invoices attached and visible. No inflated materials line - actual cost, every time.

→

D&T MARGIN

+ 10% flat

Applied once, over actual cost. No project management surcharge, no assessor layer, no opaque overhead.

→

INSURER PAYS

Actual cost + 10%

Total claim cost is transparent, competitive, and fully auditable. Insurers know exactly what they're paying for.
